from the upper edges of the tablet outlets in the bottom stage, as appropriate, in order to accommodate various conditions; however, tablets which are ejected towards the tablet outlet of a tablet feeder in a stage below the rebound prevention member from a tablet feeder in a stage above the rebound prevention member could rebound in the downwards direction, regardless of the position of the upper end of the rebound prevention member.

The invention that is set forth in claim 8 does not involve an inventive step in the light of document 1. The rebound prevention member that is disclosed in document 1 extends from the upper edges of the tablet outlets in the bottom stage, where it also functions as a cover part.

The invention that is set forth in claim 9 does not involve an inventive step in the light of document 1. A person skilled in the art could determine whether to integrate the rebound prevention member and the side wall of the falling tablet guide passage, or to configure so that the rebound prevention member is separate from the side wall of the falling tablet guide passage, as appropriate, in order to accommodate various conditions.

The tablet packaging device from the invention that is set forth in claims 1 to 5 and 10, wherein a rebound prevention member, which is inclined in a manner such that the distance from the tablet outlets increases towards the lower side of the invention, is provided at a location opposite the tablet outlets in the falling tablet guide passage, is not disclosed in any of the documents that are cited in the international search report, and would not have been obvious to a person skilled in the art.

The tablet packaging device from the invention that
